The dobutamine subsample that was used for this analysis came from 4 of the 10 multi-site (n=10) study was designed to evaluate score distribution, floor and ceiling effects, and inter-item correlations of the PSPQ, CSPQ, and mCSPQ for the ECHO procedure. All items are 5-point scales (0 = not at all, 4 = extremely). Table 1: Score distributions for the domains of the PSPQ. Table 2: Score distributions for the domains of the CSPQ. Table 3: Score distributions for the domains of the mCSPQ. Table 4. Spearman rank and polyserial inter-item correlations for the PSPQ. Table 5. Spearman rank and polyserial inter-item correlations for the CSPQ. Table 6. Spearman rank and polyserial inter-item correlations for the mCSPQ.
